# The electronic energy $E$ for $N$ -electron systems

$$E = \sum_{ik} H_{ik} \Gamma_{ki} + \sum_{ijkl} \langle ij|kl \rangle D_{kl,ij}$$

- $\Gamma_{ki}$ : 1-RDM
- $H_{ik}$ : core-Hamiltonian
- $D_{kl,ij}$ : 2-RDM
- $\langle ij|kl \rangle$ : Coulomb integrals

$E[N, \Gamma, \mathbf{D}]$  is an explicitly known functional of the 1- and 2-RDMs!

Variational Methods:

$$DFT \quad (\text{reconstruction}) \quad RDMs \quad (\text{contraction}) \quad CI, MCSCF, \\ \rho(\mathbf{r}) \implies \Gamma, D \quad \longleftarrow \Gamma^N \longleftarrow \Psi \quad CCSD, \dots$$

# Outline

- 1 Introduction to the DMFT and NOFT
- 2 Solving the system of equations
  - computational efficiency of the method
- 3 Results and chemical accuracy
  - examples of systems, where DFT yields pathological failures
  - potentiality of the NOF theory.
- 4 Closing Remarks

# 1-RDM Functional

Last term in the Energy:  $U[N, \mathbf{D}] = \sum_{ijkl} \langle ij|kl \rangle D_{kl,ij}$  can be replaced by an unknown functional of the 1-RDM:

$$V_{ee}[N, \Gamma] = \min_{\mathbf{D} \in \mathbf{D}(\Gamma)} U[N, \mathbf{D}]$$

$\mathbf{D}(\Gamma)$ : family of N-representable 2-RDMs which contract to the  $\Gamma$

$$E[N, \Gamma, \mathbf{D}] \Rightarrow E[N, \Gamma] = \sum_{ik} H_{ik} \Gamma_{ki} + V_{ee}[N, \Gamma]$$

T. L. Gilbert, Phys. Rev. B 12, 2111 (1975); M. Levy, Proc. Natl. Acad. Sci. U.S.A. 76, 6062 (1979)

# Natural Orbital Functional

The 1-RDM can be diagonalized by a unitary transformation of the spin-orbitals  $\{\phi_i(\mathbf{x})\}$ :

$$\Gamma_{ki} = n_i \delta_{ki}, \quad \Gamma(\mathbf{x}'_1 | \mathbf{x}_1) = \sum_i n_i \phi_i(\mathbf{x}'_1) \phi_i^*(\mathbf{x}_1)$$

$\phi_i(\mathbf{x})$  is the natural spin-orbital with the corresponding occupation number  $n_i$

$$E[N, \Gamma] \Rightarrow E[N, \{n_i, \phi_i\}] = \sum_i n_i H_{ii} + V_{ee}[N, \{n_i, \phi_i\}]$$

# Cumulant expansion of the 2-RDM

$$D_{pq,rt}^{\sigma\sigma,\sigma\sigma} = \frac{n_p^\sigma n_q^\sigma}{2} (\delta_{pr}\delta_{qt} - \delta_{pt}\delta_{qr}) + \lambda_{pq,rt}^{\sigma\sigma,\sigma\sigma} \quad (\sigma = \alpha, \beta)$$

$$D_{pq,rt}^{\alpha\beta,\alpha\beta} = \frac{n_p^\alpha n_q^\beta}{2} \delta_{pr}\delta_{qt} + \lambda_{pq,rt}^{\alpha\beta,\alpha\beta}$$

$$\lambda_{pq,rt}^{\sigma\sigma,\sigma\sigma} = -\frac{\Delta_{pq}^{\sigma\sigma}}{2} (\delta_{pr}\delta_{qt} - \delta_{pt}\delta_{qr})$$

$$\lambda_{pq,rt}^{\alpha\beta,\alpha\beta} = -\frac{\Delta_{pq}^{\alpha\beta}}{2} \delta_{pr}\delta_{qt} + \frac{\Pi_{pr}}{2} \delta_{pq}\delta_{rt}$$

$\Delta$ : real symmetric matrix ( $\Delta_{pq}^{\sigma_1\sigma_2} = \Delta_{qp}^{\sigma_2\sigma_1}$ )

$$\text{Sum Rules: } \sum_q' \Delta_{pq}^{\sigma\sigma} = n_p^\sigma (1 - n_p^\sigma), \quad \sum_q \Delta_{pq}^{\alpha\beta} = \Pi_{pp}$$

$\Pi$ : spin-independent Hermitian matrix

$$(\Pi_{pr}^{\alpha\alpha} = \Pi_{pr}^{\alpha\beta} = \Pi_{pr}^{\beta\alpha} = \Pi_{pr}^{\beta\beta} = \Pi_{pr}, \quad \Pi_{pr} = \Pi_{rp}^*)$$

# Conserving rule for $\hat{S}^2$ and diagonal elements

- Assume  $N^\alpha \geq N^\beta$  and high-spin multiplet state  $M_S = S$

$$\langle \hat{S}^2 \rangle = S(S+1) + N^\beta - \sum_p n_p^\alpha n_p^\beta - 2 \sum_{pq} \lambda_{pq,qp}^{\alpha\beta,\alpha\beta}$$

*conservation of the total spin*  $\rightarrow 2 \sum_{pq} \lambda_{pq,qp}^{\alpha\beta,\alpha\beta} = N^\beta - \sum_p n_p^\alpha n_p^\beta$

J. Chem. Phys. 131, 021102 (2009).

- $\lambda_{pq,qp}^{\alpha\beta,\alpha\beta} = \frac{1}{2} (\Pi_{pp} - \Delta_{pp}^{\alpha\beta}) \delta_{pq}$  for our reconstruction  
 $n_p^\alpha = n_p + m_p, n_p^\beta = n_p$

spin conserving rule:

$$\Delta_{pp}^{\alpha\beta} = n_p^\alpha n_p^\beta = n_p^2 + n_p m_p, \quad \Pi_{pp} = n_p$$

# The N-representability and off-diagonal elements

## N-representability

RDMs must be derivable from an N-particle wave function  $\Psi$

- N-representability of  $\Gamma$ :  $0 \leq n_i \leq 1$  ( $\sum_i n_i = N$ )
- lack of sufficient conditions for N-representability of  $\mathbf{D}$

One may approximate the unknown  $\Delta[\mathbf{n}]$  and  $\Pi[\mathbf{n}]$ , in terms of the occupation numbers, considering the analytic constraints imposed by necessary N-representability conditions of the 2-RDM.

- $D \geq 0, Q \geq 0 \Rightarrow \Delta_{qp}^{\sigma_1\sigma_2} \leq n_q^{\sigma_1} n_p^{\sigma_2}, \Delta_{qp}^{\sigma_1\sigma_2} \leq h_q^{\sigma_1} h_p^{\sigma_2}$
- $G \geq 0 \Rightarrow \Pi_{qp}^2 \leq n_q h_q n_p h_p + \Delta_{qp} (n_q h_p + h_q n_p) + \Delta_{qp}^2$

# Implemented Approximations

- PNOF1: Int. J. Quantum Chem. 106, 1093, 2006.
- PNOF2: J. Chem. Phys. 126, 214103, 2007.
- PNOF3: J. Chem. Phys. 132, 031103, 2010.
- PNOF4: J. Chem. Phys. 133, 111101, 2010.
- PNOF5: J. Chem. Phys. 134, 164102, 2011.

# PNOF5: $\Delta$ - and $\Pi$ -matrices for singlet states $|S = 0\rangle$

$$\Delta_{qp} = \begin{cases} n_p^2, & q = p \\ 0, & q \neq \tilde{p} \\ n_{\tilde{p}}n_p, & q = \tilde{p} \end{cases}, \quad \Pi_{qp} = \begin{cases} n_p, & q = p \\ 0, & q \neq \tilde{p} \\ -\sqrt{n_{\tilde{p}}n_p}, & q = \tilde{p} \end{cases}$$

$$n_{\tilde{p}} + n_p = 1$$

$$E^{PNOF5} = \sum_{p=1}^N [n_p (2H_{pp} + J_{pp}) - \sqrt{n_{\tilde{p}}n_p} K_{p\tilde{p}}] \\ + \sum_{p,q=1}^N '' n_q n_p (2J_{pq} - K_{pq})$$

$$(\tilde{p} = N - p + 1; \quad \sum '' : q \neq p, \tilde{p})$$

## Minimization of the functional $E^{PNOF5}$ under constraints

① Löwdin's normalization:  $2 \sum_p n_p = N$  ( $n_{\bar{p}} + n_p = 1$ )

②  $N$  representability of the 1-RDM:  $0 \leq n_p \leq 1$

$\implies n_p = \cos^2 \gamma_p, n_{\bar{p}} = \sin^2 \gamma_{\bar{p}}$  : Conjugate Gradient Method

③ Orthonormality of natural orbitals:  $\langle \varphi_p | \varphi_q \rangle = \delta_{pq}$

$\implies$  Method of Lagrangian multipliers

$$\Omega = E - 2 \sum_{pq} \varepsilon_{qp} [\langle \varphi_p | \varphi_q \rangle - \delta_{pq}]$$

## Euler equations for the natural orbitals $\{\varphi_p(\mathbf{r})\}$

$$n_p \hat{V}_p |\varphi_p\rangle = \sum_q \varepsilon_{qp} |\varphi_q\rangle, \quad \varepsilon_{qp} = n_p \langle \varphi_q | \hat{V}_p | \varphi_p \rangle$$

$$\hat{V}_p(1) = \hat{H}(1) + \hat{J}_p(1) - \sqrt{\frac{n_p}{n_p}} \hat{K}_p(1) + \sum_{q=1}^N n_q [2\hat{J}_q(1) - \hat{K}_q(1)]$$

$[\Lambda, \Gamma] \neq 0 \Rightarrow$  solution cannot be reduced to diagonalization of  $\Lambda$

$$\Lambda = \{\varepsilon_{qp}\}, \quad \Gamma = \{n_p \delta_{pq}\}$$

- Self-consistent iterative diagonalization procedure

J. Comp. Chem. 30, 2078 (2009)

# The Hermiticity of $\Lambda$ and the Aufbau Principle

- The Lagrangian is Hermitian at the extremum:  $\varepsilon_{pq} = \varepsilon_{qp}^*$ 
  - Define a new Hermitian matrix **F**: (off-diagonal elements)

$$F_{pq} = \theta(q - p) [\varepsilon_{pq} - \varepsilon_{qp}^*] + \theta(p - q) [\varepsilon_{qp}^* - \varepsilon_{pq}]$$

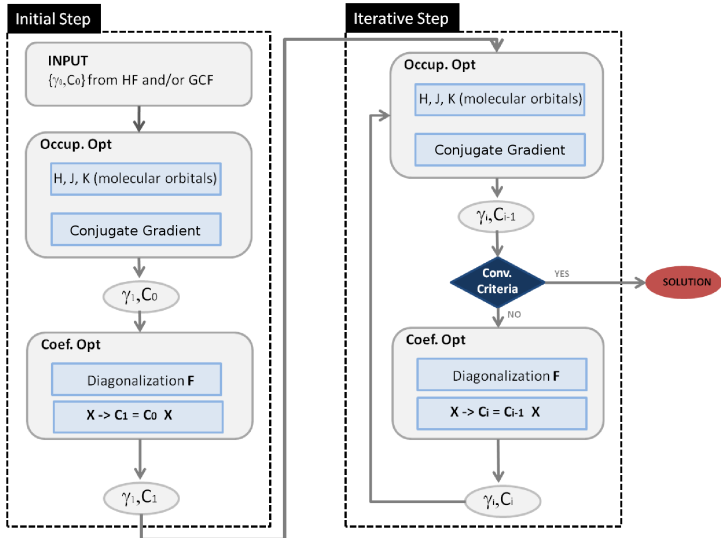

- $\{F_{pp}\}$  cannot be determined from the Hermiticity of  $\Lambda$
- First order perturbative theory (Hillier 1970, Saunders 1973)

$$E = E^0 + 2 \sum_{p < q} \Delta_{pq} F_{pq}^0 = E^0 + 2 \sum_{p < q} \frac{|F_{pq}^0|^2}{F_{pp}^0 - F_{qq}^0}$$

$\{F_{qq}^0 > F_{pp}^0\} \rightarrow E$  is bound to drop upon diagonalization of **F**<sup>0</sup>

$\Rightarrow$  Aufbau Principle for diagonal elements

J. Comp. Chem. 30, 2078 (2009)

## Parallel Efficiency (H<sub>2</sub>O, cc-pV6Z, 290 GBF)

cores (n)	nodes	Time (h)	Total # Iter.	Efficiency (%)
1	1	62.6	998	100
2	1	34.5	1090	99
4	2	16.2	1004	97
8	2	8.1	1013	98
12	3	5.8	1056	95
24	2	2.5	866	91
24	4	2.5	866	90
36	3	1.9	945	87
48	4	1.7	1115	86

Maximum speedup that can be achieved is  $1/(1-P) \sim 40$   
 P is the proportion of the program made parallel ( $\sim 97.5\%$ )

$$E_n = \frac{T_1}{nT_n} \frac{IT_n}{IT_1} \times 100\%$$

## Closing Remarks

- it is now feasible to perform expensive NOFT calculations. The parallelization of the bottlenecks of our code allows us to achieve an execution 37 times faster than the sequential one, in 48 processors, with an efficiency of 86%.
- the functional N-representability plays a crucial role towards achieving chemical accuracy. The PNOF5 can describe in a balanced way chemical bonding situations that evolve gradually from non-degenerate to degenerate states. Integer number of electrons have been found on the dissociated atoms.
- two equivalent orbital representations are possible. PNOF5 could be a practical tool for the interpretation of the chemical bonding.
