Possible subtitles of presentation

Can we connect the quantum theory calculations and data obtained by measurements to create useful explanation of some phenomena?

Porphycene is isomer of porphyrin

Occurring in nature

Synthetic

Motivation

Why are we interested in porphycenes?

- Model systems for experimental studying **hydrogen transfer reactions and H-bonds properties.**

P. Fita, N. Urbańska, C. Radzewicz, J. Waluk, *Chem. Eur. J.* **15**, 4851 (2009);

- Inconsistence between **reaction rates** measured in crystals (nanosecond) and solutions (picoseconds).

U. Langer, C. Hoelger, B. Wehrle, L. Latanowicz, E. Vogel, H.H. Limbach, *J. Phys. Org. Chem.* **13**, 23 (2000);

Z. Smedarchina, M. F. Shibl, O. Kuehn, A. Fernandez-Ramos, *Chem. Phys. Lett.* **436**, 314 (2007);

- Potential applications in **photodynamic therapy.**

I. Czerski, A. Listkowski, J. Nawrocki, N. Urbańska, H. Piwoński, A. Sokołowski, O. Pietraszkiwicz, M. Pietraszkiwicz, *J. Waluk, J. Porphyrins Phthalocyanines*, 2012, **16**, 589-602.

Transient absorption anisotropy measurements

$$r = \frac{\Delta A_{\parallel} - \Delta A_{\perp}}{\Delta A_{\parallel} + 2\Delta A_{\perp}}$$

Data analysis

$$r(t) = \left[a \left(\underbrace{r_0^0 - r_{\infty}^0}_{\text{ground state}} e^{-t/\tau_r^0} + r_{\infty}^0 \right) + (1-a) \left(\underbrace{r_0^1 - r_{\infty}^1}_{\text{excited state}} e^{-t/\tau_r^1} + r_{\infty}^1 \right) \right] \times e^{-t/\theta} \quad \tau_r = (k_{1 \rightarrow 2} + k_{2 \rightarrow 1})^{-1}$$

rotational diffusion

Measured porphycenes derivatives

TTPO: $R_1, R_4, R_7, R_{10} = -\text{Ph}$
 TTPC: $R_1, R_4, R_7, R_{10} = -^t\text{Bu}$

CMPC: $R_5, R_6, R_{11}, R_{12} = -\text{Me}$
 PCRC: $R_5, R_6, R_{11}, R_{12} = -^n\text{Pr}$

OEPC: $R_1, R_2, R_3, R_4, R_7, R_8, R_9, R_{10} = -\text{Et}$

2M2B: $R_5, R_6, R_{11}, R_{12} = -\text{Me}$
 2MPC: $R_5, R_6, R_{11}, R_{12} = -^n\text{Pr}$

DTBP: $R_1, R_4 = -^t\text{Bu}$
 MTBP: $R_1 = -^t\text{Bu}$
 TTBP: $R_1, R_4, R_{11} = -^t\text{Bu}$

Quantum Chemical Calculations

1 Computational Methods:

- DFT/B3LYP - hybrid functional

2 Basis Sets:

- 6-311(d,p)
- 6-31G(d,p)

3 Computational Software:

- Gaussian09 - geometry optimization
- Cubegen - electrostatic potential and total density plot
- NCIPLOT - plots of the reduced density gradient (RDG)

4 Visualizations made in:

- VMD - molecular graphics software
- Multiwfn - multifunctional wavefunction analyzer
- Molden - pre- and post processing program of molecular and electronic structure
- TopMod - visualisation ELF (Electron Localisation Function) data

5 The nature of all stationary points has been verified by vibrational analysis;

NCI for porphycene

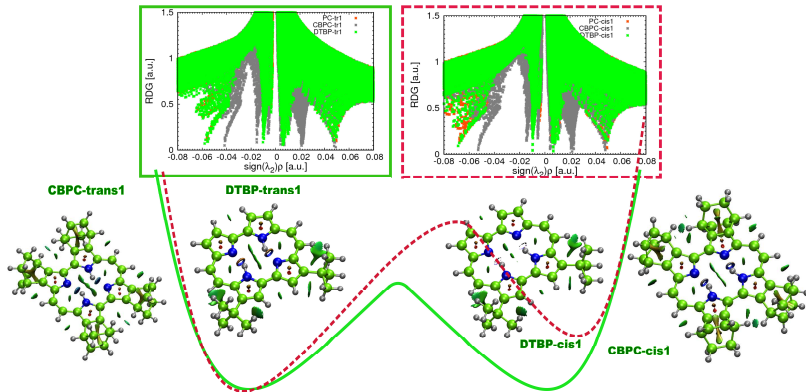

ELF analysis for porphycene

Isomerization - in case of symmetric substitution

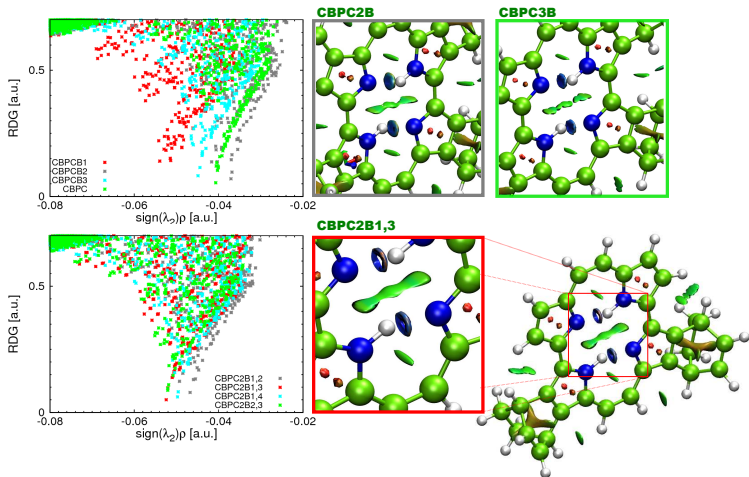

Isomerization - in case of lowered symmetry

Effect of the substituent - number of substituents

Influence of bicyclo[2.2.2]octen substitution

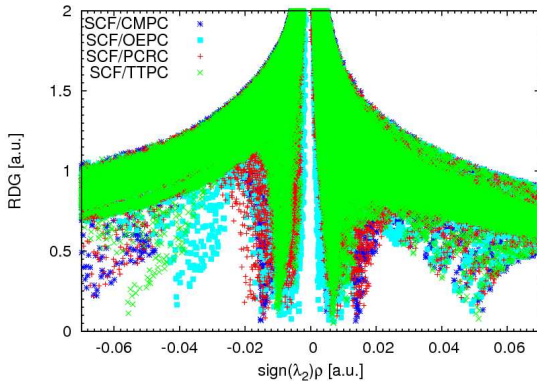

Correlation with the chemical shift

Correlation with the $\text{sign}(\lambda_2)\rho$ value

Correlation with the $sign(\lambda_2)\rho$ value

System	Measurement	B3LYP/6-311(d,p)
-	$\tau_{PT}S(0)(ps)$	$sign(\lambda_2)\rho$
OEPC	100	-0.0405
PC	1.80(1)	-0.0555
DTBP	1.20(1)	-0.0550
TTBP	0.80(1)	-0.0556

CMPC	0.10(1)	-0.0704
PCRC	0.10(1)	-0.0720

$\text{sign}(\lambda_2)\rho$ value as a function of proton transfer time

Conclusions

- Asymmetric distribution of electron density in the inner cavity of porphycenes is the result of asymmetric substitution;
- Hydrogen atoms transfer time depends on electron density located along the H-bonds;
- Thermodynamic parameters are not sufficient for predicting the proton transfer time;
- NCI analysis seems to be an ideal tool to search for the derivatives characterized by the time of proton transfer in the range of 10-100 ps;
