I think that any "rigorous" definition of a chemical bond is bound to be impoverishing,

I think that any "rigorous" definition of a chemical bond is bound to be impoverishing, leaving one with the comfortable feeling, "yes (no), I have (do not have) a bond," but little else.

I think that any "rigorous" definition of a chemical bond is bound to be impoverishing, leaving one with the comfortable feeling, "yes (no), I have (do not have) a bond," but little else. And yet the concept of a chemical bond, so essential to chemistry, and with a venerable history, has life, generating controversy and incredible interest. Even if we can't reduce it to physics.

I think that any "rigorous" definition of a chemical bond is bound to be impoverishing, leaving one with the comfortable feeling, "yes (no), I have (do not have) a bond," but little else. And yet the concept of a chemical bond, so essential to chemistry, and with a venerable history, has life, generating controversy and incredible interest. Even if we can't reduce it to physics.

My advice is: Push the concept to its limits.

I think that any "rigorous" definition of a chemical bond is bound to be impoverishing, leaving one with the comfortable feeling, "yes (no), I have (do not have) a bond," but little else. And yet the concept of a chemical bond, so essential to chemistry, and with a venerable history, has life, generating controversy and incredible interest. Even if we can't reduce it to physics.

My advice is: Push the concept to its limits. Be aware of the different experimental and theoretical measures out there.

I think that any "rigorous" definition of a chemical bond is bound to be impoverishing, leaving one with the comfortable feeling, "yes (no), I have (do not have) a bond," but little else. And yet the concept of a chemical bond, so essential to chemistry, and with a venerable history, has life, generating controversy and incredible interest. Even if we can't reduce it to physics.

My advice is: Push the concept to its limits. Be aware of the different experimental and theoretical measures out there. Accept that (at the limits) a bond will be a bond by some criteria, maybe not others, respect chemical tradition, relax, and instead of wringing your hands about how terrible it is that this concept cannot be unambiguously defined, have fun with the fuzzy richness of the idea.

IUPAC Definitions Reaction mechanism

Albeiro Restrepo (UdeA)

Dissecting reaction mechanisms

September 26, 2016 6 / 51

Reaction mechanism

"A detailed description of the process leading from the reactants to the products of a reaction, including a characterization as complete as possible of the composition, structure, energy and other properties of reaction intermediates, products and transition states."

"Inferences concerning the electronic motions which dynamically interconvert successive species along the reaction path (as represented by curved arrows, for example) are often included in the description of a mechanism. It should be noted that for many reactions all this information is not available and the suggested mechanism is based on incomplete experimental data. "

Albeiro Restrepo (UdeA)

IUPAC Definitions Primitive changes

Albeiro Restrepo (UdeA)

Dissecting reaction mechanisms

September 26, 2016 8 / 51

Primitive changes

"One of the conceptually simpler molecular changes into which an elementary reaction can be notionally dissected. Such changes include bond rupture, bond formation, internal rotation, change of bond length or bond angle, bond migration, redistribution of charge, etc. The concept of primitive changes is helpful in the detailed verbal description of elementary reactions, but a primitive change does not represent a process that is by itself necessarily observable as a component of an elementary reaction." IUPAC Definitions Transition state

Albeiro Restrepo (UdeA)

Dissecting reaction mechanisms

September 26, 2016 10 /

Transition state

"In the formalism of transition state theory the transition state of an elementary reaction is that set of states (each characterized by its own geometry and energy) in which an assembly of atoms, when randomly placed there, would have an equal probability of forming the reactants or of forming the products of that elementary reaction. "

IUPAC Definitions Intrinsic reaction coordinate

Intrinsic reaction coordinate

"A minimum-energy reaction path on a potential energy surface in mass-weighted coordinates, connecting reactants to products via the transition state."

IUPAC Definitions Concerted reaction

Albeiro Restrepo (UdeA)

Dissecting reaction mechanisms

September 26, 2016 14 / 51

Concerted reaction

"Two or more primitive changes are said to be concerted if they occur within the same elementary reaction. Such changes will normally (though perhaps not inevitably) be energetically coupled. (In the present context, energetically coupled means that the simultaneous progress of the primitive changes involves a transition state of lower energy than that for their successive occurrence.) In a concerted process the primitive changes may be synchronous or asynchronous"

IUPAC Definitions Synchronicity

Albeiro Restrepo (UdeA)

Dissecting reaction mechanisms

September 26, 2016 16 /

Synchronicity

"A concerted process in which the primitive changes concerned (generally bond rupture and bond formation) have progressed to the same extent at the transition state is said to be synchronous."

The IRC Toy system

Albeiro Restrepo (UdeA)

Dissecting reaction mechanisms

Toy system

A well known $S_N 2$ reaction

$\mathsf{CI}^- + \mathsf{CH}_2\mathsf{FCI} \longrightarrow \mathsf{CH}_2\mathsf{FCI} + \mathsf{CI}^-$

Albeiro Restrepo (UdeA)

$\mathsf{CI}^- + \mathsf{CH}_2\mathsf{FCI} \longrightarrow \mathsf{CH}_2\mathsf{FCI} + \mathsf{CI}^-$

 $S_N 2$ reactions are concerted,

Albeiro Restrepo (UdeA)

Dissecting reaction mechanisms

September 26, 2016 19 / 51

$CI^- + CH_2FCI \longrightarrow CH_2FCI + CI^-$

 $S_N 2$ reactions are concerted, synchronous,

Albeiro Restrepo (UdeA)

Dissecting reaction mechanisms

September 26, 2016 19 / 51

$\mathsf{CI}^- + \mathsf{CH}_2\mathsf{FCI} \longrightarrow \mathsf{CH}_2\mathsf{FCI} + \mathsf{CI}^-$

 $S_N 2$ reactions are concerted, synchronous, symmetric,

Albeiro Restrepo (UdeA)

Dissecting reaction mechanisms

September 26, 2016 19 / 51

$\mathsf{CI}^- + \mathsf{CH}_2\mathsf{FCI} \longrightarrow \mathsf{CH}_2\mathsf{FCI} + \mathsf{CI}^-$

 $\mathsf{S}_N\mathsf{2}$ reactions are concerted, synchronous, symmetric, have a pentacoordinate carbon at the $\mathsf{T}\mathsf{S}$

Toy system

A well known $S_N 2$ reaction

$CI^- + CH_2FCI \longrightarrow CH_2FCI + CI^-$

 $\mathsf{S}_N\mathsf{2}$ reactions are concerted, synchronous, symmetric, have a pentacoordinate carbon at the $\mathsf{T}\mathsf{S}$

Final remarks

There is a lot of useful information to be obtained from the IRC.

Final remarks

There is a lot of useful information to be obtained from the IRC.

Nucleophilic addition can be described as a highly non–synchronous process, during which, for all bonds involved, bond breaking/forming evolve at different rates. The mechanism can be described as a series of events in which the $S \cdots C$ bond defines the interaction between the reactants and the progress of the chemical transformation.

Final remarks

There is a lot of useful information to be obtained from the IRC.

Nucleophilic addition can be described as a highly non–synchronous process, during which, for all bonds involved, bond breaking/forming evolve at different rates. The mechanism can be described as a series of events in which the $S \cdots C$ bond defines the interaction between the reactants and the progress of the chemical transformation.

We postulate that highly complex chemical reactions that involve several primitive changes, lower their activation energies by favoring non-synchronicity.
