1) Effective Hamiltonian : $H^{\text{eff}} = h^{\text{eff}}(1) + h^{\text{eff}}(2) + h^{\text{eff}}(3) + \dots$

with :
$$h^{\text{eff}}(i) = -\frac{1}{2} \nabla_{r_i}^2 - \underbrace{\frac{Z}{r_i}}_{\substack{\text{averaged} \\ \text{repulsion}}} + \text{Rep}(i)$$

with : $h^{\text{eff}}(i) = -\frac{1}{2} \nabla_{r_i}^2 - \frac{Z}{r_i} + \underbrace{\text{Rep}(i)}_{\text{averaged repulsion}}$

2) Parametrization : ε, β, S

Same as in Hückel theory :

$\begin{cases} \varepsilon_i : \text{orbital } i \text{ self-energy} \\ \beta : \text{resonance integral} \\ S : \text{overlap integral} \end{cases}$

Rule for calculating H and S terms :

Start with the determinants diagonal product

Then generate permutations :

- only one side

⇒ This will give H and S expressions both samely proportional to $\langle \Psi_{VB} | \hat{H} | \Psi_{VB} \rangle$ and $\langle \Psi_{VB} | \Psi_{VB} \rangle$ respectively

- $d_{C-C} < \text{sum of vdW radii } (3.45\text{\AA})$, but much longer than C-C 2e bonds (1.54\AA)

«Pancake bonding»

- What kind of bonding in DTCNE_2^{2-} ?

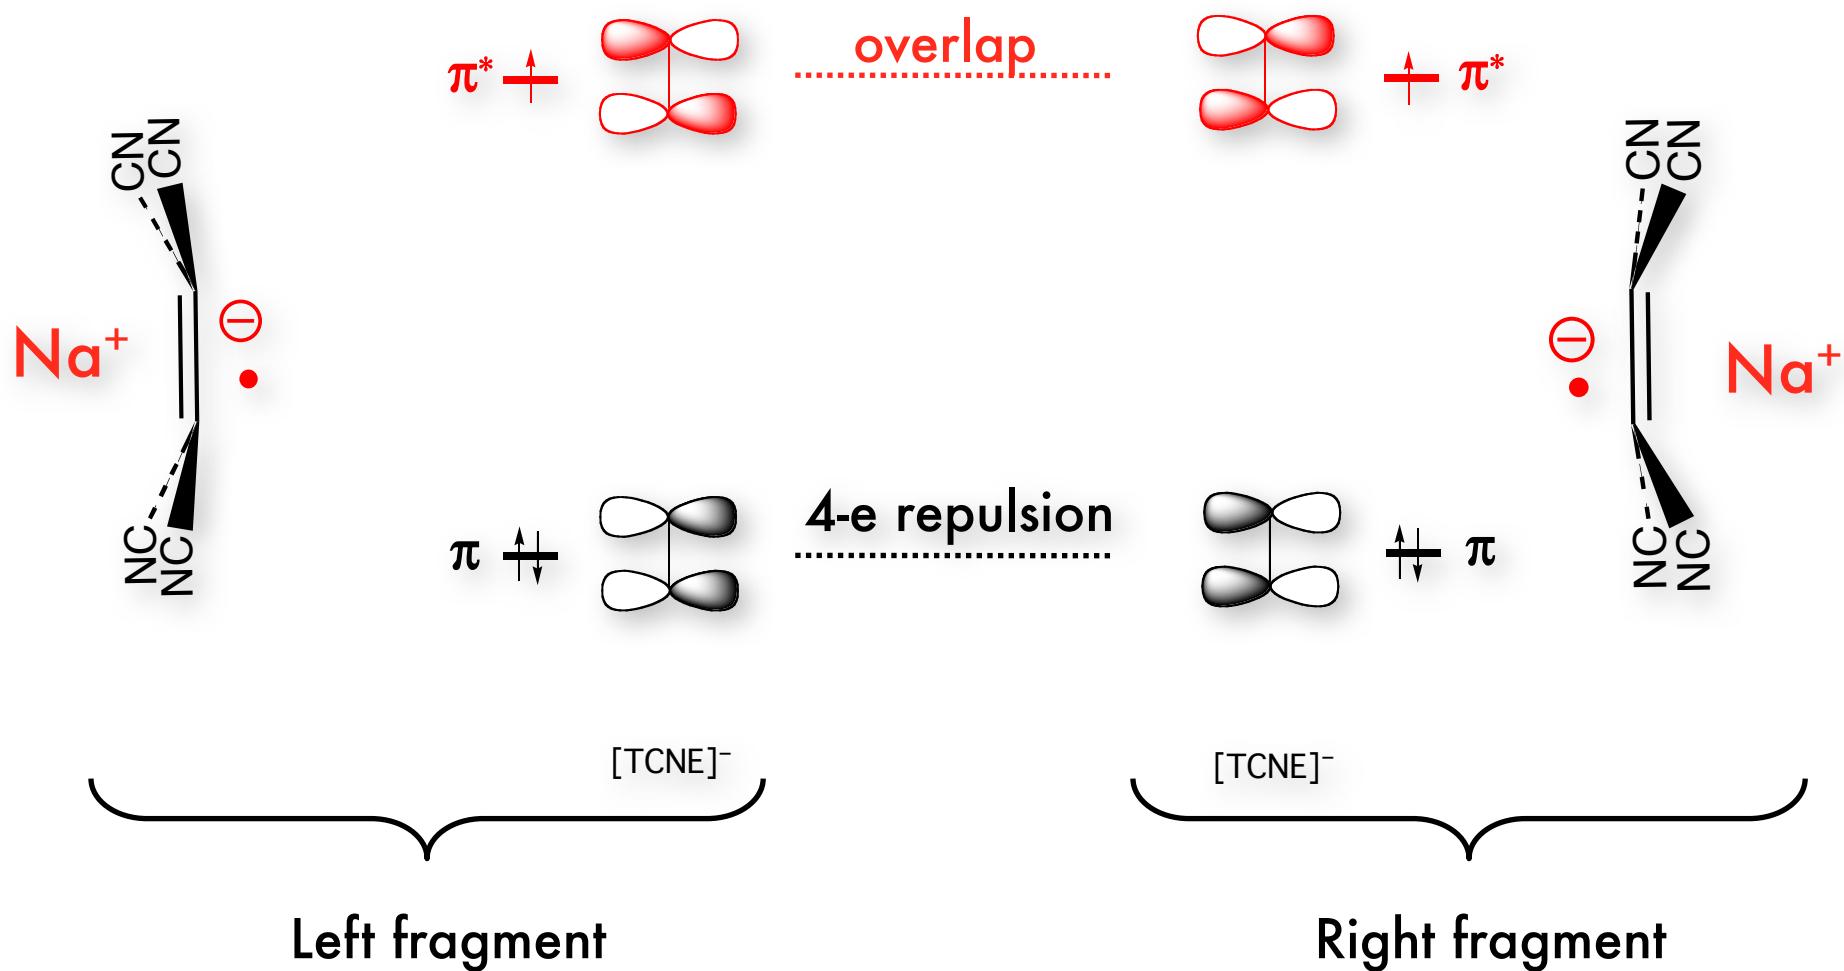

$$D_e \approx 80. \text{ kcal/mol}$$

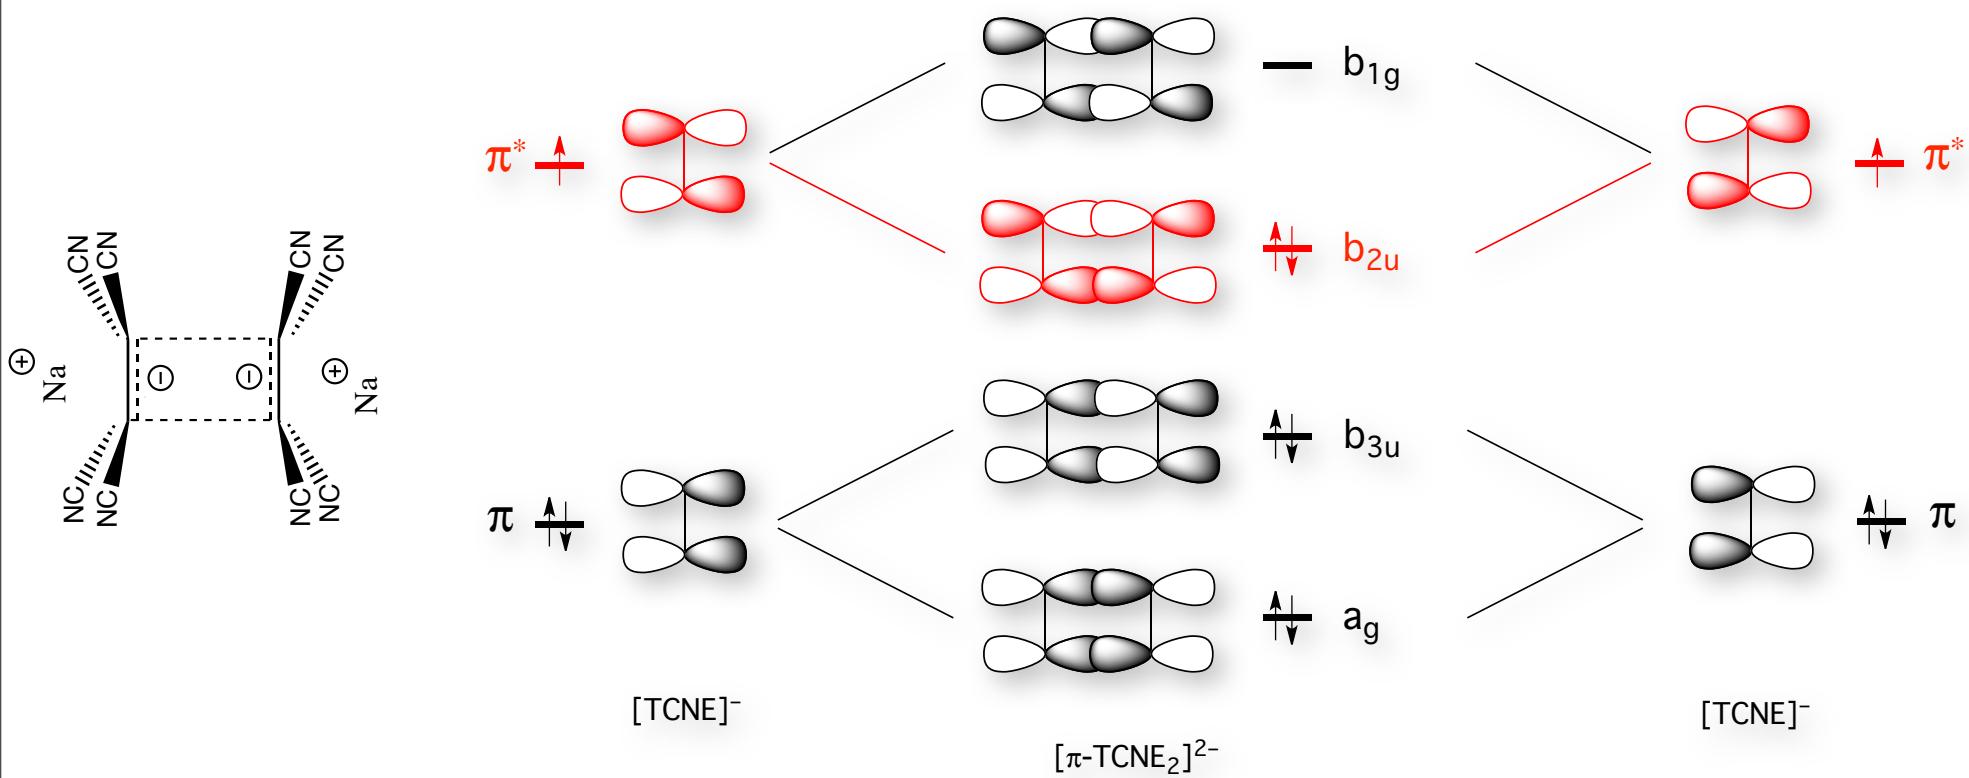

$$D_e \approx 11. \text{ kcal/mol} !$$

Quantitative MO computations

- 2x2 CASSCF describes well 2e bonds (particularly stretched...) : not the case here !
- Contribution of dynamical correlation energy huge !

Situation

- What kind of bonding in DTCNE_2^{2-} ?

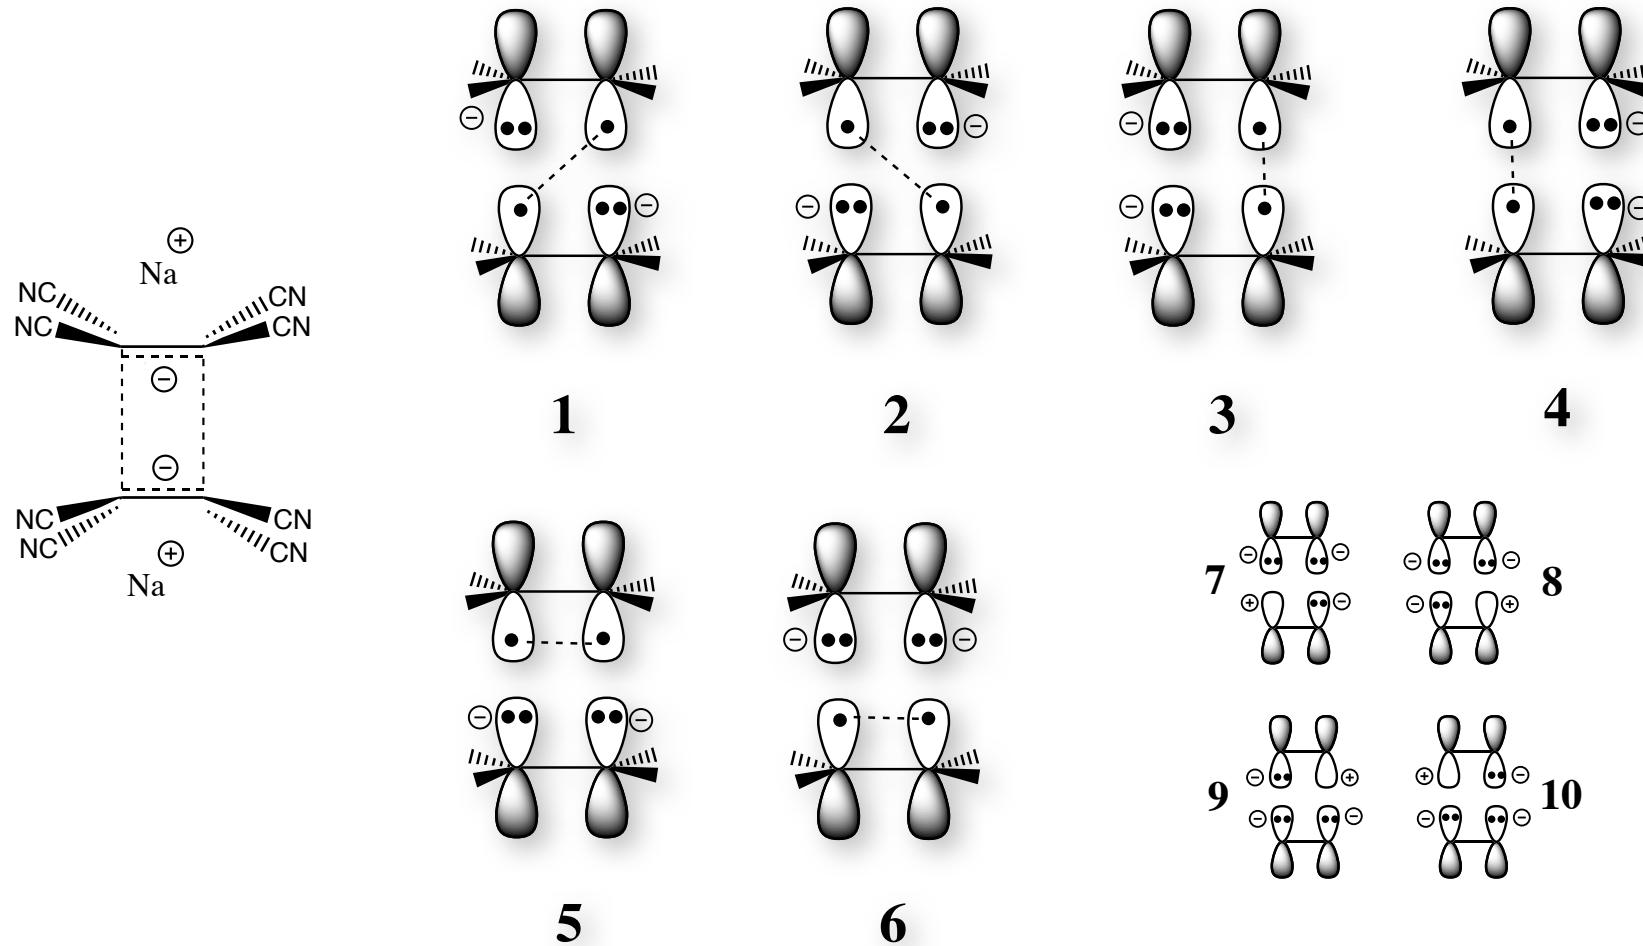

- Same bonding distance whatever the counter-ion, the environment, the system...
- MO analysis propose a 4c/2e bond, but GVB-PP fails to account for any bonding...
- Distance too short, bond energy too strong to be dispersion...

Ab initio VB calculations

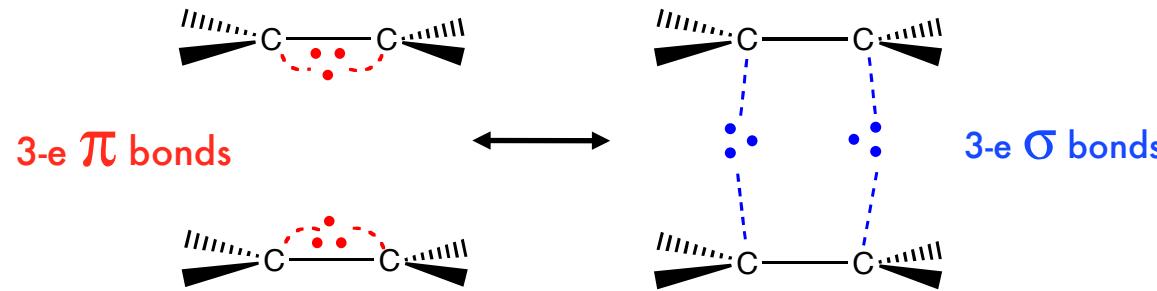

- Some tests of credibility :

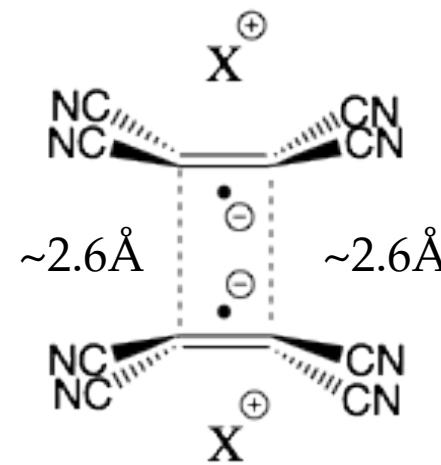

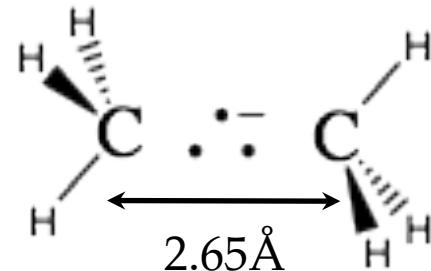

Characteristics of 3e bonds :

- 1) Large equilibrium distances : $d(S-S) \approx 2.0 \text{ \AA}$; $d(S \cdot : S^-) \approx 2.8 \text{ \AA}$
- 2) Small overlap ($S_{opt} \approx 0.17$)
- 3) Importance of dynamical correlation

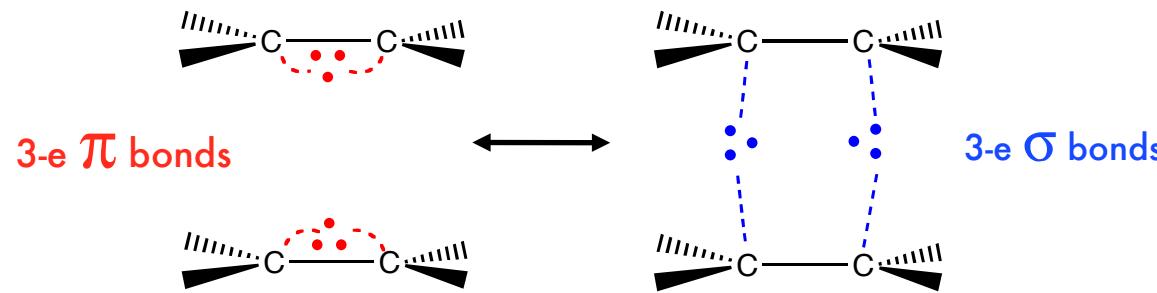

Ab initio VB calculations

1) Interfragment bond length close to 3e⁻ bonded ethane anion :

Ab initio VB calculations

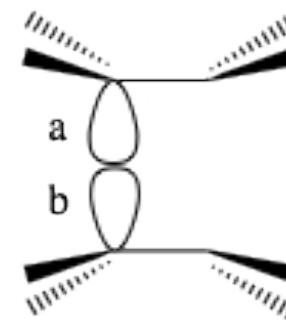

2) Interfragment orbital overlaps close to optimal 3e⁻ bond value :

$$S_{opt} \approx 0.17$$

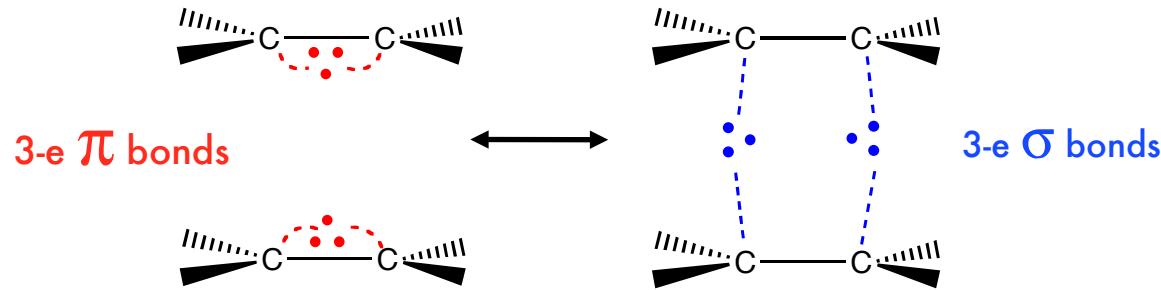

for any 3-e bond
(demonstrated in
qualitative VB theory
as well as Extended Hückel theory)

$$S_{ab} = 0.15$$

(computed)

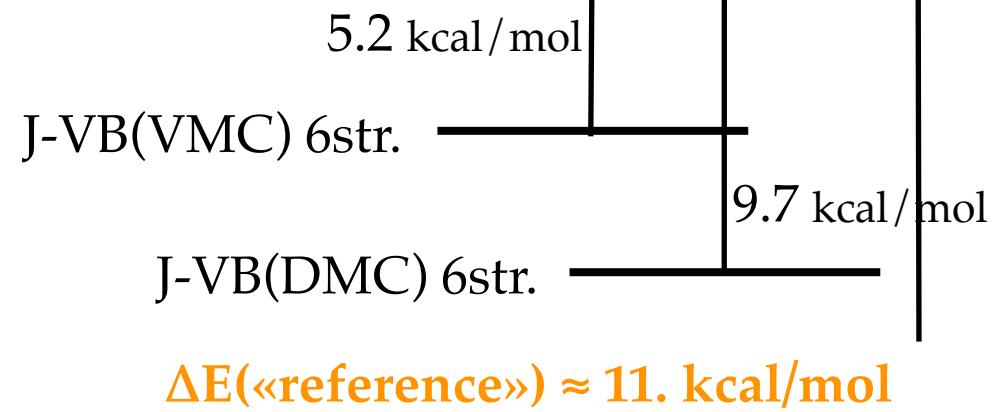

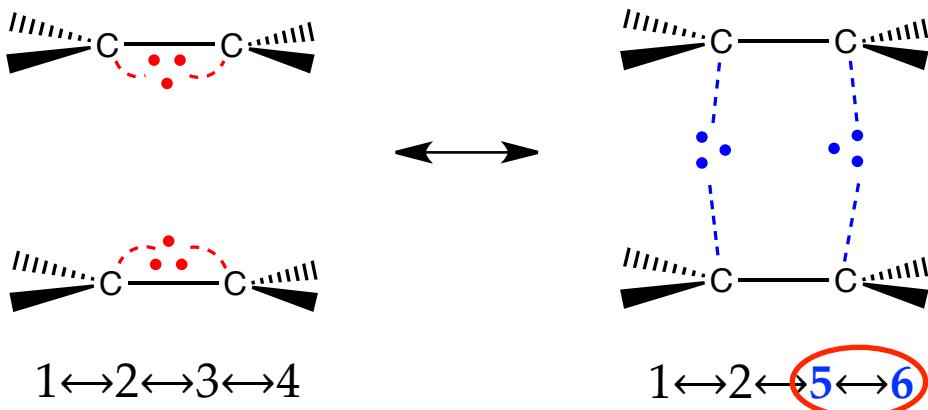

Ab initio VB calculations

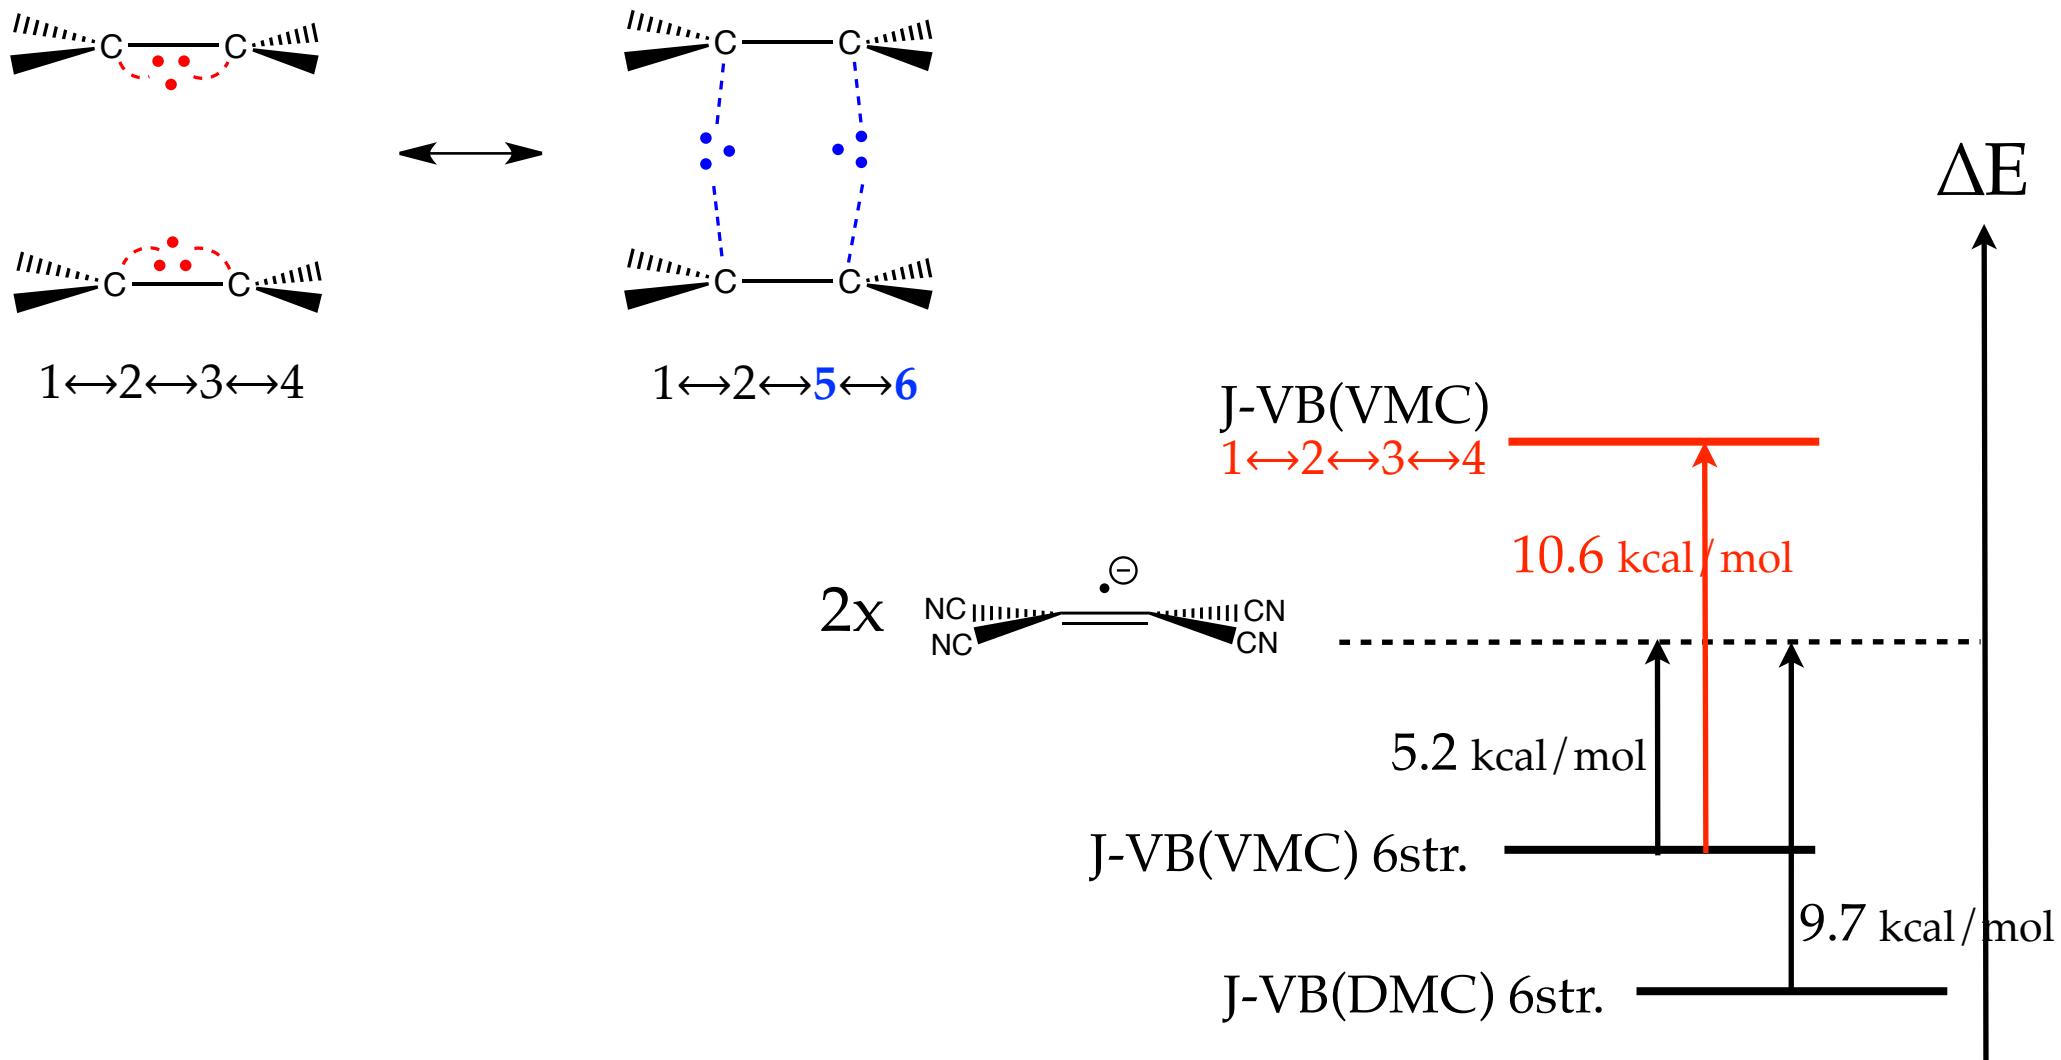

3) Contribution of dynamic correlation to bonding:

- In $[F\cdot\cdot F]^-$, dynamic correlation contributes ~ 30 kcal/mol to bonding
- In $[\text{TCNE}]_2^{2-}$, dynamic correlation contributes > 30 kcal/mol to bonding

Conclusion

- About $[\text{TCNE}]_2^{2-}$:

- Even when electrostatic interaction is repulsive (axial conformation), the two fragment anions are directly bonded by **a pair of 3-e bonds**
- This simple picture explains at once :
 - 1) the unusual bond length,
 - 2) the interfragment overlap,
 - 3) the importance of dynamic correlation
- Qualitative VB analysis already reveal the 3e bond nature of the interfragment interaction, then *ab initio* VB quantitatively support it.
